The present sequence is that of human TASK2 (TWIK-related acid-sensitive potassium channel 2), a novel member of the 2p domain potassium channel family that also includes TW-K-1 (see AAY79673) and TASK1 (see AAY79674). TASK2 is a unique potas ium transport channel that is regulated by external pH, and is predc inantly expressed in kidney and epithelial tissues. The invention clates to: identification of the native renal channel with the properties of TASK2; identification of potent pharmacology that specifically modulates the activity of the TASK2 subunit in viv: ind the generation of mice in which the TASK2 subunit in viv: ind the generation of mice in which the TASK2 gene has been in viv: ned the invention also relates to diagnostic tests and therapeutic methods to: detect

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 other cytokines in certain cell populations. Protein also exhibits commune stimulating or immune deficiencies and is riders, and to treat the creatment of various immune deficiencies and is riders, and to treat confections. The protein is also used for treat of unitable sclerosis, systemic lupus ery hematosus, and rheumatoid conditions such as asthma, and in immune suppression after organ conditions such as asthma, and in immune suppression after organ conditions such as asthma, and in immune suppression after organ conditions such as asthma, and in immune suppression after organ conditions such as asthma, and in immune suppression after organ crassplantation. The protein is useful in regulation of haematopoiesis and consequently in the treatment of myeloid o lymphoid cell conditions the protein is also used in the reatment of osteoporosis or osteoarrhritis and in the treatment of production of the conditions consisted tooth repair processes. The protein is used in the reatment of seteoporosis constead in the protein is used in the reatment of nervous system disorders such as Alzheimer's disease, arkinson's disease, and contraction and conditions resulting from system crous regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues, and conditions resulting from system crotokine damage. They are also used for promoting or inhibiting tissue inferentiation. They are conditions resulting from coagulation activities end prevention of conditions resulting from coagulation activities end prevention of inhibitors or agonists of receptor/liqand interactions. They are used to

The CC TWIK-2 (Tandem of p domains in a Weak Inward rectifying potassium (K+) CC channel-2). TWIK-3 and TWIK-4 nucleic acids and proteins are useful as CC targets for developing modulating agents to regulate a variety of CC cellular processes. They may be useful for developing novel diagnostic CC and therapeutic agents for potassium channel associated disorders, CC e.g. central nervous system disorders (e.g. Alzheimer's disease, CC dementia, Parkinson's disease, multiple sclerosis, amyotrophic lateral CC sclerosis, progressive supranuclear palsy, epilepsy, Creutzfeldt-Jacob CC disease), psychiatric disorders (e.g. depression, schizophrenic CC disorders, Korsakoff's psychosis, mania, anxiety disorders or phobic CC disorders), learning or memory disorders (e.g. amnesia or age-related CC memory loss), neurological disorders (e.g. migraine), obesity, and CC cardiac disorders. The nucleic acids, proteins, protein homologues and CC cardiac disorders. The nucleic acids, proteins, protein homologues and CC cardiac disorders. The nucleic acids, be inserted into vectors and CC memory lossy vectors, to express TWIK protein, to detect TWIK CC modulate TWIK activity, and screen for drugs or compounds that CC modulate TWIK activity. Host cells may be used to produce non-human CC transgenic animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         for modulating activity of TWIK-1 type channe's may also be useful therapeutically, e.g. for control of epileps, arrhythmia, vascular disease, neurodegeneration (particularly of ischaemic or anoxic origin), endocrine or muscular disorders. The CDMA and the vectors can also be used to create transgenic animals (especially knock-out animals) for use as models of TWIK-1 related diseases. Analysis of the sequence of the TWIK-1 gene may be used for pre-natal diagnosis of disease. Antibodies can be used to detect TWIK-1 channels and for inhibiting or activating the channels in vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            channels consisting of 4 transmembrane segme: 3 and two P domains, being only weakly rectifying. The CDNA, vect. 3, the cells express TWIK-1 type channels and the protein are use to compensate for deficiency of potassium channels in varias tissues. Compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a protein commising a potassium channel with the properties of a TWIK (Tandem of P downins in a Weak Inward rectlifying K+) 1 channel. This is the first "ber of a new family of channels consisting of 4 transmembrane segme" and two P domains, and

  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DB

Submitted (APR-1997) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: WEAKLY INWARD RECTIFYING POTASSIUM CHANNEL.
-!- SUBUNIT: HOMODIMER (POTENTIAL).
-!- SUBUNIT: HOMODIMER (POTENTIAL).
-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN (POTENTIAL).
-!- TISSUE SPECIFICITY: WIDELY EXPRESSED WITH HIGH LEYELS IN HEART BRAIN AND LOWER LEVELS IN PLACENTA, LUNG, LIVER AND KIDNEY.
-!- MISCELLANEOUS: INHIBITED BY BARTUM, QUININE, QUINIDINE AND INTERNAL ACIDIFICATION. ACTIVATED BY PROTEIN KINASE C.
-!- SIMILARITY: BELONGS TO THE TWO PORE DOMAIN FAMILY OF POTASSIUM
                                                                                                                                                                                                                                                                                                                                                                                                                            CIW1_HUMAN STANDARD; PRT; 336 AA.
